Systems Security

Spring 2018
Jon Shidal

Plan for Today

- Announcements
 - Always bring your laptop to class
 - anyone without a laptop?
 - HW1 officially assigned today, due 1 pm Wednesday
- Questions? <https://powcoder.com>
- System Security Fundamentals
 - Security Principles
 - Security Building Blocks
- Assignment

Assignment Project Exam Help

SECURITY PRINCIPLES

Three Natural Questions

- Does it work?
- What will it cost? [Assignment Project Exam Help
https://powcoder.com](https://powcoder.com)
- Is it secure? [Add WeChat powcoder](#)
- Question: are these 3 questions similar in nature?

Does it work? & What will it Cost?

- Functional Requirements
 - Does our system meet them?
 - A lot of the field focuses on this.
- What will it cost?
 - Time?
 - Money?

Assignment Project Exam Help

Add WeChat powcoder

What does “Is it secure?” Mean?

- Can anyone else access my data?
- Can I control who uses the device?
- Can anyone interfere with or prevent my usage of the device?
- Can someone spy on my usage of the device?
- Can someone delete or corrupt my data?
- Can anyone see the data I send or receive on a network?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

“Can anyone else access my data?”

- An easy source of trouble: the word “anyone”

Assignment Project Exam Help

- Suppose some are authorized and others are not

<https://powcoder.com>

- Let's try to be precise and systematic in answering this question

Add WeChat powcoder

“Can anyone else access my data?”

- Does the device have authenticated users?
 - Is it a multi-user device?
 - Are data access control mechanisms in place?
 - If users sign-in, how do they do so?
 - Is it possible for someone to trick the system into accepting a false user identity?
- Can unauthorized users gain access?
 - Has the device been determined to be hack-proof, and impervious to unauthorized access through technical means?

“Can anyone else access my data?”

- Can authorized users delegate access to their data?
 - If a user can grant data access to another user, does the original user have any control over who else might get access?
- Is there an administrative user account that can create and modify user accounts?
 - If so, then whoever controls the administrative account can control access to data.
- Can the system be reset to factory defaults without destroying data?
 - Some systems provide a means to reset a system following a lost account credential that keeps the original data intact.

“Can anyone else access my data?”

- Is the data archived on a backup service or device?

– If so, how is access to that data managed?

<https://powcoder.com>

- Do local laws require a back-door for access by government authorities?

– If so, can a user verify either that such an access request is legitimate, or whether such accesses have taken place?

Have we reached the bottom?

- That was question 1 of 6...
- It seems clear that “Is the system secure?” is a different kind of question
<https://powcoder.com>
- **We need to develop a perspective to manage the seemingly boundless complexity**

Add WeChat powcoder

People, Process, Technology

- Security has non-technical aspects
- Our systems are vulnerable from many angles.
- To answer “Is it secure?” we need to address each

Examples

| Factor | Security Measure | Attack |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| People | Provide training periodically to ensure that users have an understanding of security risks and are aware of common pitfalls. | Fool users into divulging their access credentials by sending convincing email messages that appear to be legitimate requests. These tactics are known as phishing attacks. |
| Process | Design rules and procedures for users and systems that are intended to improve security and increase the effort required on the part of any attacker. For instance, a policy may dictate that a user account be locked out after 5 unsuccessful login attempts. Such a policy will make it impossible for remote attackers to gain access by submitting large numbers of possible passwords. | In systems that provide remote access and also lockout accounts after some number of failed attempts, attackers can disrupt service and cause problems by assembling a list of user account names and then launching failed login attempts in order to lock all the accounts out. Then, the attacker can send immediate phishing messages with false instructions for re-enabling their account. |
| Technology | Software-defined systems typically pull together a large number of libraries and applications to provide functionality. Each of these libraries and applications represent a point of attack, hence, systems should be designed with the means to regularly update and apply any security-related patches. | Software with an exploitable weakness is the primary attack target in Internet-connected systems because they can be sought and attacked in an automated fashion. Some attackers discover and exploit weaknesses, others simply wait for exploits to be published then find and attack systems susceptible to the exploit. |

Add WeChat powcoder

People

Security measure: Provide training periodically to ensure that users have an understanding of security risks and are aware of common pitfalls

Assignment Project Exam Help

<https://powcoder.com>

Attack: Fool users into divulging their access credentials by sending convincing email messages that appear to be legitimate requests. Phishing attacks.

Add WeChat powcoder

Process

Security measure: Design rules and procedures for users and systems that are intended to improve security and increase the effort required on the part of the attacker. e.g. a policy may dictate that a user account be locked out after 5 failed login attempts. Remote attackers cannot endlessly attempt different passwords.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Attack: Attacker can still disrupt service by attempting multiple logins and forcing accounts to be locked. Then send phishing email with “instructions” for unlocking account.

Technology

Security Measure: Software systems use a lot of libraries and applications to provide functionality.

Assignment Project Exam Help

<https://powcoder.com>

Attack: Software with an exploitable weakness is the prime target for attackers. Attackers find vulnerabilities, exploits get published and attacks spread.

Sleight of hand?

- Many of these issues seem like apples and oranges.
 - Do they all fit what you thought of as security?
- Unauthorized access is clearly a security violation
- What about obstructing authorized access?
 - Is it really the same thing?
- How many issues might we dream up?
- What about time?
 - Someone has access, do they keep it forever?
 - Can they make copies of data and keep them?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Information Security (InfoSec)

- As a field, InfoSec has dealt with these broader issues

Assignment Project Exam Help

- InfoSec encompasses computer and network systems security
- “CIA” triad is one contribution of the field

<https://powcoder.com>

Add WeChat powcoder

Confidentiality, Integrity & Availability

- Confidentiality

- Is it secret?
- Is it kept secret even while being transmitted to an authorized user?
- Is it important to keep even the existence of the data secret?
- Is the list of authorized users kept secret?

- Integrity

- Availability

Confidentiality, Integrity & Availability

- Confidentiality
- Integrity
 - Has it been tampered with?
 - In storage?
 - While being transmitted to authorized user?
- Availability

SECURITY BUILDING BLOCKS

Security Concepts & Building Blocks

- Encryption & Cryptography
 - What most people think of as Security.
 - Its Math so it must be hard and it must be cool.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- Authentication
 - Identifying who or what we are talking to?

Encryption & Cryptography

- Single-key crypto (aka symmetric crypto)
 - Encrypted data is indistinguishable from random data
 - Use a “shared secret” or “key” to encrypt/decrypt
- Public-key crypto (aka asymmetric crypto)
 - I have a pair of keys, public and private
 - I give you my public key
 - You use the public key to encrypt
 - I use my private key to decrypt

How do we share and manage keys?

- How do I get your public key?
 - Web, email, USB stick
- How do I get a stranger's public key?
- What problems arise?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Certificates

- We place our trust in “Certificate Authorities”, or CAs
- A certificate contains
 - a public key,
 - the name of the owner of the public key,
 - the name of the attesting CA,
 - and the signature of the CA.
- Which CAs can we trust?
 - Up to Microsoft, Google, Apple, Firefox, etc.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

VeriSign, March 2001

- Issue two Microsoft root/CA certs to a fraudster
- Oops!
[Assignment Project Exam Help](https://powcoder.com)
<https://powcoder.com>
- All MSFT up-to-date software “revokes” these certificates
– No public admissions of fraud

Alternative: Web of Trust

- Use decentralized trust model
- If you know me, sign my certificate
 - Anyone who trusts you can now trust me
 - Anyone who distrusts you can now distrust me

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Authentication: Matching Identity with Credentials

- Can be based on
 - Something you know: password
 - Something you have: a key
 - Something you are: fingerprint

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Two-Factor Authentication

- Biometrics are flaky
- A best practice is to rely on two methods to authenticate
 - Maybe not every time, but periodically
- Does anyone here use two-factor authentication?
